

# GRIDVISION

## Grid Monitoring and Operations Application

### User Manual

A practical guide for operators, officers, and administrators in power utilities

Version 1.1 | September 2026

---

About this guide: This manual describes the GridVision application using the feature set intended for multi-utility deployment. Menu names and available actions may vary slightly by organization, user role, and enabled modules.

---

### Contents

Part 1: Station Management System

About GridVision

Roles and access

Sign in and navigation

Dashboard

Operator entries and log book

Alerts and notifications

Analytics and reports (Load / Energy Analysis, Interruption Analysis, Indices)

Shift duty and handover (Shift creation, roster, start duty, handover and takeover)

Offline operation and synchronization

Administration and profile

Troubleshooting and good practices

Part 2: Shutdown Management

Shutdown Management overview

Shutdown roles and access  
Shutdown dashboard  
My Requests  
Initiate or approve a shutdown request  
Shutdown reports

## PART 1 | STATION MANAGEMENT SYSTEM

This part covers GridVision's station monitoring, operator entries, alerts, analysis, reports, and shift handover features.

### About GridVision

GridVision is a web and mobile application for monitoring distribution-grid operations. It brings station information, operating readings, feeder interruptions, alerts, shift records, analytics, and reports into one workspace.

#### What you can do

- View operational status and recent activity across assigned stations.
- Record parameter readings and feeder interruption details.
- Receive notifications about alerts and shift-duty events.
- Review trends and generate operational reports.
- Record shift handovers and acknowledge the incoming handover.
- Continue selected entries during a temporary network outage and synchronize them when connectivity returns.

---

Data visibility: The stations and records you can see depend on your organization's configuration and your assigned role.

---

### Roles and access

#### Operator

Records station readings and interruptions, reviews alerts, and completes assigned shift-duty and handover actions.

## Officer

Monitors the stations assigned to the officer, reviews operating status and reports, and follows up on exceptions. Officers do not perform operator shift-duty actions unless separately assigned an operator role.

## Administrator

Manages authorized application setup such as users, role assignments, organizational links, and module access. Administrative options are shown only to authorized users.

## Sign in and navigation

1. Open the GridVision web address or launch the installed mobile application.
2. Enter the email address and password provided by your organization, then choose Sign In.
3. If prompted to set a password from an invitation, follow the setup link and create a password.
4. Use Forgot password? on the sign-in screen to request a password reset email. Open the link on the same device or browser when possible.
5. After sign-in, choose the available module or open the main application workspace.

## Main areas

- Dashboard: current operational overview and recent activity.
- Analytics: trends and summarized operational analysis.
- Alerts: active and historical system or operating alerts.
- Reports: log book and other available reports.
- More: additional tools such as operator entry, settings, and administration, depending on access.

---

Security: Use your own account, keep your password private, and sign out on shared devices. Do not share password-reset or invitation links.

---

## Dashboard

The dashboard provides a quick view of operational information available to your account. Depending on configuration, it may show key totals, recent events, interruptions, alert status, or a timeline for the current day.

- Review the date or time range shown on each card before interpreting a value.
- Use the refresh control, if present, when you need the latest data. Live updates may appear automatically when the connection is available.
- Open the related feature or report for detailed records; dashboard summaries are not a substitute for the underlying log.

## **Operator entries and log book**

### **Record an operating parameter**

1. Open Operator Entry or the parameter-entry function.
2. Select the station and the relevant equipment or parameter.
3. Enter the observed value and confirm the observation time. Check units and decimal placement.
4. Review the entry for accuracy, then submit it.
5. Confirm that the application shows a success message or that the entry appears in the log.

### **Record a feeder interruption**

1. Open the interruption-entry function.
2. Select the station and feeder.
3. Enter the interruption start time and the requested event details, such as cause or remarks.
4. When service is restored, record the restoration time and any other required details.
5. Review and submit. Correct incomplete or inaccurate information promptly using the application's supported edit process.

### **Log book**

Use the Log Book or Log Book Report to review recorded station events and entries. Apply available station, date, or category filters, then inspect the record details. Reports can be used to print or download when those controls are enabled.

---

Accurate records: Enter observed times and values as accurately as possible.  
Avoid creating duplicate entries when a save appears delayed; first check  
whether the entry is already listed.

---

## Alerts and notifications

The Alerts area presents notifications generated for operational events or configured application conditions. A notification may also be delivered to a registered device when push notifications are enabled.

- Open an alert to review its station, time, category, and available details.
- Use the available filters to focus on a station, status, or period.
- Acknowledge or act on an alert only when the relevant action is provided and you are authorized to do so.
- If a notification does not arrive, open the Alerts screen directly and check device notification permissions and network connectivity.

## Analytics and reports (Load / Energy Analysis, Interruption Analysis, Indices)

### Analytics

Analytics summarizes recorded data to help users review patterns over time and compare operational activity. Select the relevant period, station, or other available filters. Allow the results to finish loading before drawing conclusions, and verify important findings against detailed records.

### Load / Energy Analysis

Use this tab to review peak-demand patterns at utility, station, and feeder level. Choose the available period (7 days, 15 days, 30 days, or 3 months). Station-wise and feeder-wise charts help compare demand; feeder options depend on the selected station. Changing the station refreshes the feeder selection and chart. Use the charts to spot peaks and trends, then verify readings in the underlying log book.

### Interruption Analysis

Review interruption count, duration, restoration time, and recorded causes for the selected period and station or feeder where filters are available. Frequency shows how often interruptions occurred; duration and restoration time show how long supply was affected. Use cause summaries to identify recurring issues, and confirm details against the interruption records.

## Indices

The current indices view focuses on SAIFI and SAIDI, calculated from the interruption records available for the selected scope and period. SAIFI (System Average Interruption Frequency Index) represents the average number of sustained interruptions experienced per consumer. SAIDI (System Average Interruption Duration Index) represents the average total interruption duration per consumer. Compare like-for-like periods and scopes; incomplete interruption or consumer data can affect the result.

## Reports

- Choose the report type available to your role, such as a log book or interruption report.
- Set the reporting period and filters, then run or refresh the report.
- Review the result on screen. Use Download PDF, Print, or another export option if provided.
- Check the selected period and filters before sharing a report.

---

Interpretation: Analytics depend on the completeness and accuracy of records entered into the system. A blank chart can mean there is no matching data for the selected filters.

---

## Shift duty and handover (Shift creation, roster, start duty, handover and takeover)

Shift handover keeps outgoing and incoming operator records connected. The workflow records the handover and links duty completion and acceptance so the next operator can review the shift context.

### Create the shift

An authorized administrator or roster manager creates the shift for the required station and date/time period, using the configured shift pattern and local duty rules.

### Assign the roster

Add the operators scheduled for that station and shift. Check each operator's account, role, station assignment, and shift timing. The roster should include every operator expected to report; correct omissions or wrong assignments before the shift begins.

### **Review the roster**

Operators should verify their assigned station and shift in Current Shift. If the roster is missing or incorrect, contact the administrator or supervisor so it can be corrected before duty actions are attempted.

### **Start duty**

At the start of the shift, each operator signs in with their own account and completes the available Start Duty / handover acceptance flow. Duty events are attributed to the individual operator and the scheduled shift.

The roster establishes which operators are expected at each station and shift. Each operator uses their own account; roster assignment does not itself start duty or count as handover acceptance.

### **Before duty handover and takeover**

#### **Outgoing operator: end duty and hand over**

1. Open Current Shift and review the shift information.
2. Add the handover information needed by the incoming shift. Where shared drafts are available, entries may show which operator added them.
3. Review the handover carefully. Submitted handover information is treated as a record; later additions are recorded as amendments where supported.
4. Choose End Duty & Hand Over Shift and confirm. The action submits the handover and ends your duty together.

#### **Incoming operator: review and start duty**

1. Open Current Shift. If a handover is available, review its entries and any amendments.
2. Add comments if needed, then choose Accept Handover and Start Duty. Acceptance is recorded for the individual operator.
3. If no handover is available, choose Start Duty Without Handover only after confirming the acknowledgement that no handover was received.
4. If a handover is submitted later, review and accept it when prompted. The application may prevent ending duty until the required handover acceptance is complete.

### **Team and exception behavior**

- Operators on the same shift act as individuals; each operator may need to complete their own acceptance before ending duty.

- A handover can become available when the first outgoing operator submits it. Other outgoing operators can link to the same handover and add amendments where enabled.
- If you started without a handover and one arrives later, use the late-handover prompt to review and accept it.
- If an action is blocked, read the on-screen reason and complete the outstanding acknowledgement or acceptance. Contact an administrator or supervisor if the shift roster appears incorrect.

---

Connectivity: Shift handover actions require an online connection. Wait for confirmation before closing the screen or repeating a submission.

---

## Offline operation and synchronization

Selected operator entries may be saved on the device when the network is temporarily unavailable. Offline support is limited to the entry types enabled in your application; shift handover and other online-only actions may be unavailable.

- If the app indicates that an entry is queued or pending synchronization, keep the app installed and allow it to reconnect.
- When connectivity returns, queued entries are sent automatically in order. Check the application for the final synchronization status.
- Do not submit the same event again simply because the network is slow; check the pending queue or recent records first.
- If an entry continues to fail, note the displayed error and contact support. Avoid clearing app data or browser storage while unsynchronized entries remain.

## Administration and profile

### Profile and sign out

Use the account menu to view profile information or sign out. If your name, email, role, or assigned station is incorrect, request correction through your organization's administrator.

### Administration

Authorized administrators can use the administration area to manage configured users and organizational access. Follow your organization's account approval and access-control procedures. Assign only the access required for each person's duties.

## Troubleshooting and good practices

| Issue                              | What to check                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cannot sign in                     | Check the email address and password. Use Forgot password? if necessary. If an invitation or reset link has expired, request a fresh one from the administrator. |
| Screen is blank or data is missing | Check the selected station, date range, and filters. Confirm network connectivity, then refresh or sign out and back in.                                         |
| Entry does not appear              | Check whether it is pending offline synchronization, then check recent records before retrying to avoid duplication.                                             |
| Notification not received          | Check the Alerts screen, device notification permissions, internet access, and whether notifications are enabled for your account.                               |
| Handover action is blocked         | Review the displayed reason. Check for a missing acceptance, unreviewed late handover, incomplete roster, or online-connection requirement.                      |
| Report is empty                    | Broaden the date range or remove filters and run it again. Confirm that matching records exist for that period.                                                  |
| App behaves unexpectedly           | Record the screen, time, action taken, and any error message. Share these details with your application support contact.                                         |

### Good practices

- Enter records promptly and verify station, time, units, and values before submission.
- Use the application only with your assigned account.
- Review the result of a submission before retrying it.
- Keep the app and device online when completing actions that need server confirmation.
- Report incorrect rosters, access, or operational data through your utility's established support channel.

## Quick reference

| Need to...                       | Go to...                  |
|----------------------------------|---------------------------|
| See today's operational overview | Dashboard                 |
| Enter a reading or interruption  | Operator Entry            |
| Review notifications             | Alerts                    |
| Review trends                    | Analytics                 |
| Run or export a report           | Reports / Log Book Report |
| Complete shift handover          | Current Shift             |

For account access, incorrect assignments, or unresolved technical issues, contact your organization's GridVision administrator or designated support team.

## PART 2 | SHUTDOWN MANAGEMENT

Shutdown Management helps utility teams submit, review, approve, and track planned and emergency shutdown requests. Its core workflow is Request → Pending Approval → Approved or Rejected. The available action depends on the user's assigned role.

---

Current screen set: This guide describes the agreed four-screen workflow: Dashboard, My Requests, Initiate/Approve SD Request, and Reports. Additional scheduling or execution tools may be enabled in a later release or by organization configuration.

---

### Shutdown Management overview

Use Shutdown Management to document why equipment or a feeder needs to be taken out of service, when the work is proposed, who will carry it out, and what safety arrangements are required. Each submitted request is tracked by a unique SD number (for example, SD-2026-010).

#### Request lifecycle

- Draft or initiate: enter the outage and work details.
- Pending Approval: the request has been submitted and awaits an authorized decision.
- Approved: an authorized approver has approved the request. Coordinate the actual outage through your utility's operating procedures.
- Rejected: an authorized approver has declined the request; review the remarks and follow local process before submitting a revised request.

---

Approval is not a switching instruction: An approved SD request records authorization in GridVision. Carry out isolation, permits, switching, and restoration only under the utility's approved safety and operating procedures.

---

## Shutdown roles and access

### Requesting officer / field officer

Creates and submits shutdown requests for the offices and stations within the user's assigned scope, and follows the request status in My Requests.

### Approver

Reviews submitted requests within the approver's assigned scope and records an Approve or Reject decision with mandatory remarks. Users may have both request and approval access where organizational policy allows, but the system prevents a user from approving their own request.

### Administrator

Maintains authorized users, role assignments, office/station scope, and module access. Contact the administrator if the request or approval scope is incorrect.

## Shutdown dashboard

The Dashboard gives an at-a-glance view of shutdown activity in the user's authorized jurisdiction. Use it to identify requests that may need attention; open the relevant request for its complete details.

- **Scheduled Today:** approved requests planned for the current day, where scheduling information is available.
- **Awaiting Approval:** requests that still need an approval decision.
- **In Progress:** shutdown work recorded as underway, if execution tracking is enabled.
- **Restoration Overdue:** items whose expected restoration time has passed without the corresponding update, if restoration tracking is enabled.
- **Emergency Shutdowns:** emergency requests needing visibility or follow-up.
- **Today's Timeline:** planned, approved, in-progress, or completed events for the day.
- **Attention Required:** may flag imminent starts, pending technical review, overdue restoration, or conflicting outages when those checks are configured.

---

Dashboard values: Counts reflect the user's access scope and selected date. Some operational indicators depend on the organization's enabled workflow and data updates.

---

## My Requests

My Requests lists the shutdown requests created by the signed-in user. It is the quickest place to check whether a request is waiting, approved, or rejected.

- Find a request using its SD number, station, equipment/feeder, requested date, or status where search and filters are provided.
- Use status tabs or filters such as All, Pending Approval, Approved, and Rejected, if shown.
- Open a request to review its submitted information and any decision remarks.
- If rejected, read the approver's remarks and follow your utility's process before correcting and resubmitting. Avoid creating a duplicate request unless directed by the approver or administrator.

## Initiate or approve a shutdown request

The Initiate/Approve SD Request screen adapts to the user's role: requesters enter a new request, while authorized approvers review and decide on a submitted request.

### Create and submit a request

1. Open Initiate/Approve SD Request and choose the request or initiation mode.
2. Select the shutdown type: Planned or Emergency.
3. Enter the purpose, requested date, proposed start time, and expected restoration time. Add an alternate date/time and priority if relevant and available.
4. Select the office, station/substation, voltage level, equipment type, and the specific equipment or feeder. Include bus section and affected downstream feeders when applicable.
5. Describe the work clearly. Identify the executing team, contractor/agency, person in charge, and mobile number where requested.
6. Complete the safety requirements and attach supporting documents when available and required.

7. Review all selections and times, then submit. Record the generated SD number for follow-up.

## Review and decide on a request

1. Open a request assigned to your approval scope and review its purpose, timing, station/equipment, affected feeders, work description, team, safety information, and attachments.
2. Check for operational conflicts and missing information using your utility's established review process.
3. Choose Approve or Reject. Enter the required decision remarks; remarks are mandatory.
4. Submit the decision and confirm that the updated status and decision remarks are visible.

---

Self-approval: A requester must not approve their own request. Route it to an authorized approver.

---

## Good request practice

- Use clear work descriptions that explain the task and the equipment involved.
- Check that proposed start and expected restoration times are realistic and internally consistent.
- Identify all affected feeders and downstream areas to support coordination.
- Include relevant safety details and supporting attachments before submission.
- For emergency work, follow the utility's emergency operating and safety procedures in parallel with application recording.

## Shutdown reports

Reports help review shutdown requests across a selected period and scope. Choose a report type if offered, then set the relevant filters before generating the report.

- Date range: limits the reporting period.
- Station: narrows results to a selected station or substation.
- Status: focuses on pending approval, approved, rejected, or other available states.

- Equipment/Feeder: filters requests for a specific asset.
- Requested By: identifies requests submitted by a particular user.
- Generate: applies the selected criteria and displays matching results.
- Export: downloads the report in an available format, such as PDF or CSV.  
Review the filters and data before sharing the export.

---

No results: If a report is empty, widen the date range, remove restrictive filters, and check whether matching requests are within your access scope.

---

## Shutdown Management quick reference

| Need to...                                        | Open...                     |
|---------------------------------------------------|-----------------------------|
| See shutdown activity and items needing attention | Dashboard                   |
| Track requests you submitted                      | My Requests                 |
| Create a request or make an approval decision     | Initiate/Approve SD Request |
| Filter and export shutdown information            | Reports                     |

For operational execution, switching authorization, safety clearances, and restoration, follow your utility's approved procedures and the instructions of the responsible control authority.
